## **PRACTICE PROJECT**

### **Aim:**

To create The E-commerce application shows the list of similar products available in stock. By checking the product details, it will search for that product in the database and displays the number of products available in the store in Jenkins and Java Eclipse

### **Descriptions:**

#### **STEP 1:**

Develop the E-commerce Application:

First, create the e-commerce application using Java and a web framework like Spring Boot. This application should have endpoints for displaying product details, searching for similar products, and checking product availability in the store.

#### **STEP 2:**

##### **Set Up a Database:**

You need a database to store product details and availability information. Use a relational database system such as MySQL, PostgreSQL, or H2 for development.

.Build and Test the Application:

Build and test your e-commerce application in Eclipse to ensure that it works correctly and provides the desired functionality.

#### **STEP 3:**

##### **Configure Jenkins:**

Set up Jenkins on your server and configure it for your project.

#### **STEP 4:**

##### **Create a Jenkins Pipeline:**

Create a Jenkins pipeline for your project that includes the following stages:

Checkout: This stage checks out your source code from your version control system (e.g., Git).

## **STEP 5:**

### **Trigger the Jenkins Pipeline:**

Manually trigger the Jenkins pipeline or configure it to run automatically whenever changes are pushed to your version control repository.

### **SOURCE CODE:**

```
pipeline{

    tools{

        maven 'mymaven'

    }

    agent {label 'win_slave'}

    stages{

        stage('clone the repo')

        {

            steps{

                git https://github.com/hindujar/Pacticeproject_phase2.git

            }

        }

        stage('Seleniumtest')

        {

            steps{

                sh 'mvn test'
```

```
}  
  
}  
  
}  
  
}
```
